

Milestone 2 Report

Threat Intelligence & Geospatial Risk Analytics

1. Objective

The objective of Milestone 2 was to extend the initial incident analytics framework into a **Threat Classification and Geospatial Intelligence Dashboard**. The milestone focused on classifying incidents according to threat and severity characteristics, identifying geographical hotspots, analyzing incident concentration across locations, and examining response performance geographically. The dashboard was designed to help stakeholders identify high-risk areas and understand where security resources may need greater attention.

2. Dashboard

The Milestone 2 dashboard combines **threat classification, severity analysis, and geographical intelligence** into an interactive Power BI interface. It includes KPI cards, severity distribution, incident categories, location-based analysis, Top 10 risk cities, response time by city, and geographical visualizations. Interactive slicers allow users to filter the analysis by **date, category, severity, and city**.

3. Key Insights

Insight 1 — Severity-Based Risk Identification

The dashboard separates incidents into **Minor, Major, and Critical** severity levels. This allows stakeholders to distinguish routine incidents from high-priority events and focus attention on incidents with greater potential impact.

Insight 2 — Geographical Hotspots

The geographical analysis identifies locations with comparatively high incident concentration. The **Top 10 risk-city analysis** helps highlight areas that may require increased monitoring and operational preparedness.

Insight 3 — Location-Based Response Performance

The **Response Time by City** analysis enables comparison of response performance across locations. This helps identify geographical areas where response operations may require further investigation or improvement.

4. Business Recommendations

Recommendation 1 — Prioritize High-Risk Locations

Locations with high incident concentration should receive greater monitoring, preparedness measures, and appropriate allocation of security or emergency resources.

Recommendation 2 — Improve Response Planning

Locations showing relatively higher response times should be investigated to identify possible operational constraints. Resource positioning and response planning can then be adjusted to improve emergency response efficiency.
